PREFACE

PES College of Engineering, Mandya, started in the year 1962, has become autonomous institute in the academic year 2008-09. Since, then it has been doing the academics and assessment activities successfully. The college is running eight undergraduate and eight Postgraduate programs including MBA and MCA which are affiliated to VTU, Belagavi.

India has recently become a Permanent Member of the Washington Accord. The accord was signed by the National Board of Accreditation (NBA) on behalf of India on 13th June 2014. It enables not only the mobility of our degree globally but also establishes equivalence to our degrees with that of the member nations. The implementation of Outcome Based Education (OBE) has been the core issue for enabling the equivalence and of Indian degrees and their mobility across the various countries.

Our Higher Educational Institution has adopted the Choice Based Credit System (CBCS) based semester structure with OBE scheme and grading system. Which provides the flexibility in designing curriculum and assigning credits based on the course content and hours of teaching. There lies a shift in thinking, teaching and learning process moving towards Students Centric from Teachers Centric education which enhances the knowledge, skills & moral values of each student.

Choice Based Credit System (CBCS) provides the options for the students to select from the number of prescribed courses. The CBCS provides a 'cafeteria' type approach in which the students can Choose electives from a wide range of courses of their choice, learn at their own pace, undergo additional courses and acquire more than the required credits, adopt an interdisciplinary approach for learning which enables integration of concepts, theories, techniques. These are greatly enhances the skill/employability of students.

In order to increase the Industry/Corporate readiness, many Soft Skills, self learning components and Personality Development modules have been added to the existing curriculum. In order to enhance creativity and innovation Mini Project and Industrial visit & Interaction are made mandatory for all undergraduate programs.

Dr. Umesh D. R.
Deputy Dean (Academic)
Associate Professor,
Dept. of Computer Science & Engg.

Dr. P. S. Puttaswamy
Dean (Academic)
Professor,
Dept. of Electrical & Electronics Engg.

Department of Electrical & Electronics Engineering

Profile

Department of Electrical & Electronics Engineering Programme has been accredited by NBA for 6 Academic years (2017-18 to 2022-23)

The Department of Electrical and Electronics Engineering was established right from the inception of the institute in the year 1962. The various programs offered by the Department are B.E., M.Sc., (Engg.) by research and research leading Ph.D affiliated to Visvesvaraya Technological University (VTU), Belagavi. Also, Department is affiliated for Ph.D program with University of Mysore, Mysore and Kuvempu University, Shimoga. About 100 research papers have been published by the Department faculty members in various International & National journals and conferences.

The Department emphasizes towards imparting quality education, rigorous teaching-learning, hands-on expertise and helping students to shape their all-round personality. The Department with its strong pool of faculty, well-developed laboratories, latest software and hardware facilities, contributes to develop life-long learning skills to its students and producing worthy researchers by offering doctoral research program.

The academic programs are designed and updated keeping in view the constantly changing industrial needs, skills and challenges emerging out of new research. The academic programs are well received by the industry and academia. The department has always exerted the best of its effort to meet the objectives of achieving technical excellence in the areas of Electrical and Electronics Engineering such as High Voltage Engineering, Power Electronics & Drives, Control Systems, Power Systems, Energy Systems, Analog and Digital Electronics, Signal Processing, PLC & SCADA and Microcontrollers

The Department regularly organizes industrial visits, Technical lectures by experts from industries and institutes in contemporary areas to bridge the gap between syllabi and current developments.

VISION

The department of E & E would endeavour to create a pool of Engineers who would be technically competent, ethically strong also fulfil their obligation in terms of social responsibility.

MISSION

- Adopt the best pedagogical methods and provide the best facility, infrastructure and an ambience conducive to imbibe technical knowledge and practicing ethics.
- Group and individual exercises to inculcate habit of analytical and strategic thinking to help the students to develop creative thinking and in still team skills.
- MOUs and Sponsored projects with industry and R & D organizations for Collaborative learning
- Enabling and encouraging students for continuing Education and moulding them for life-long learning process

PROGRAM EDUCATIONAL OBJECTIVES (PEOs)

PEO1: Excel in professional career and/or higher education by acquiring knowledge in mathematical, computing and Electrical & Electronics engineering principles

PEO2: Analyze real life problems and Design Electrical & Electronics Engineering system with appropriate solutions that are technically sound, economically feasible and socially acceptable

PEO3: Exhibit professionalism, ethical attitude, communications kills, team work in their profession and adapt to current trends by engaging in lifelong learning.

PROGRAMME OUTCOMES (POs)

PO-1: Graduates will apply the knowledge of mathematics, Physics, chemistry and allied engineering subjects to solve problems in Electrical and Electronics Engineering.

PO-2: Graduates will Identify, formulate and solve Electrical and Electronics Engineering problem.

PO-3: Graduates will design Electrical and Electronics systems meeting the given specifications for different problems taking safety and precautions into consideration.

PO-4: Graduates will design, conduct experiments, analyze and interpret data

PO-5: Graduates will use modern software tools to model and analyze problems, keeping in view their limitations.

PO-6: Graduates will understand the impact of local and global issues / happenings on Electrical Engineers.

PO-7: Graduates will provide sustainable solutions for problems related to Electrical and Electronics Engineering and also will understand their impact on environment.

PO-8: Graduates will have knowledge of professional ethics and code of conduct as applied to Electrical Engineers.

PO-9: Graduates will work effectively as an individual and as a member or leader in diverse teams and in multi-disciplinary settings.

PO-10: Graduates will communicate effectively in both verbal and written form.

PO-11: Graduates will plan, execute and complete projects

PO-12: Graduates will have the ability for self- education and lifelong learning

PROGRAMME SPECIFIC OUTCOMES (PSOs)

PSO1: To understand the concept in Electrical and Electronics Engineering and apply them to develop modules analyze assess the performance of various power system equipment, generation, transmission, utilization and protection mechanisms.

PSO2: Design, develop, analyze and test electrical and electronics system: Deploy control strategies for electrical dives, power system networks, power electronics, high voltage and other related applications.

P.E.S. College of Engineering, Mandya-571 401

(An Autonomous Institution Under VTU, Belagavi)

\+ Common to BE (AU, CV, ME and I&PE)

++ Common to BE (CS, EC, E&E and IS&E)

Course Title : Engineering Mathematics-III			
Course Code : P17MAT31	**Semester : 3**	**L :T:P:H : 3:2:0:5**	**Credits: 4**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr		**Weightage: CIE:50%, SEE:50%**	

Prerequisites: The student should have acquired the knowledge of Engineering Mathematics-I & II of I and II semester B.E.

Course Learning Objectives (CLOs):

The course P17MA31 aims to:

1. Describe the concepts of elementary numerical analysis such as forward/backward finite differences, central differences, interpolation and extrapolation formulae, techniques of numerical differentiation and integration.
2. Explain the nature of periodic functions Fourier series of general as well as even /odd functions valid in full range/half-range periods along with applications through practical harmonic analysis.
3. Learn modeling in terms of partial differential equations and also, learn different exact/analytical methods of solving with special emphasis on interpretation of the solution of one-dimensional wave, heat and Laplace equations with given initial and boundary conditions in the context of various engineering and technological applications.

Relevance of the course:

Engineering Mathematics-III deals with the Numerical methods to solve interpolation and extrapolation problems in engineering field.

In Fourier series analyze engineering problems arising in control theory and fluid flow phenomena using harmonic analysis

Analyze the engineering problems arising in signals and systems, digital signal processing using Fourier transform techniques.

Z-transforms & Z-transforms of standard functions to solve the specific problems by using properties of Z-transforms.

Identify and solve difference equations arising in engineering applications using inverse Z–transforms techniques

Partial Differential Equations (PDE's), order, degree and formation of PDE's and, to solve PDE's by various methods of solution.

One – dimensional wave and heat equation and Laplace's equation and physical significance of their solutions to the problems selected from engineering field

Course Content

Unit-1

Numerical Methods-I: Finite differences**:** Forward and Backward differences,Gregory-Newton forward and backward interpolation formulae, Newton's divided difference formula, Lagrange's interpolation formula and inverse interpolation formula. (All formulae without proof) – Problems only

Central differences: Gauss Forward and Backward difference formulae, Sterling's, and Bessel's formulae (All formulae without proof) – problems. **10 Hrs**

Self-Study Component: Problems using Everett's formula in Central differences

Unit-2

Numerical differentiation using Newton's forward and backward interpolation formulae, Newton's divided difference formula and Sterling's formula (All formulae without proof)-problems only and Applications to Maxima and Minima of a tabulated function.

Numerical integration: Newton- Cotes quadrature formula, Trapezoidal rule, Simpson's $(1/3)^{rd}$rule, Simpson's $(3/8)^{th}$rule, Boole's rule and Weddle's rule (All rules without proof)- Illustrative problems. **10 Hrs**

Self-Study Component: Derive Newton- Cotes quadrature formula.

Unit-3

Fourier series: Periodic functions, Fourier series- Euler's formula, Dirichlet's conditions. Fourier series of discontinuous functions, Fourier series of even and odd functions. Change of interval- Fourier series of functions of arbitrary period. Half–range Fourier series expansions, Fourier series in complex form, Practical harmonic analysis- Illustrative examples from engineering field. **11 Hrs**

Self-Study Component: Derivations of Euler's formulae

Unit-4

Fourier Transforms: Infinite Fourier transforms-properties. Fourier sine and Fourier cosine transforms, properties. Inverse infinite Fourier and inverse Fourier sine & cosine transforms – Illustrative examples.

Difference equations and Z-transforms: Definition of Z-transforms- standard Z-transforms, linearity property, damping rule, shifting rules, initial value theorem and final value theorem (All rules and theorems without proof). Inverse Z – transforms. Difference equations- basic definitions.Application of Z-transforms to solve difference equations. **10 Hrs**

Self-Study Component: Convolution theorem, Parseval'sidentities related problems.

Unit-5

Partial differential equations (PDE's): Formation of PDE's. Solution of non-homogeneous PDE by direct integration. Solutions of homogeneous PDE involving derivative with respect to one independent variable only (both types with given set of conditions). Method of separation of variables (first and second order equations). Solution of the Lagrange's linear PDE's of the type: $Pp + Qq = R$.

Applications of PDE's: One- dimensional wave and heat equations (No derivation), and various possible solutions of these by the method of separation of variables. D'Alembert's solution of wave equation. Two dimensional

Laplace's equation (No derivation)–various possible solutions. Solution of all these equations with specified boundary conditions (Boundary value problems). Illustrative examples from engineering field.

Self-Study Component: Finding the solution of non-linear equations of first order: Charpit's Method -simple problem.

11 Hrs

Text Books:

1. Higher Engineering Mathematics: B.S. Grewal, Khanna Publishers, New Delhi, 42^{nd} Ed. 2012.
2. Advanced Engineering Mathematics: - E. Kreyszig, John Wiley & Sons, 6th Ed.2007.

Reference Books:

1. Advanced Modern Engineering Mathematics: - Glyn James, Pearson Education Ltd., 3^{rd} Ed., 2007.
2. Advanced Engineering Mathematics: Peter V O' Neil Thomson, Brooks/Cole, 5^{th} Ed.
3. Higher Engineering Mathematics: - B.V. RAMANA, McGraw Hill Education, 2007

Note: - Eachunit contains ***two*** full questions of ***20 marks*** each. Students are required to Answer ***five*** full questions choosing at least ***one*** question from each unit.

Course Outcomes

After learning all the units of the course, the student is able to;

1. Apply forward, backward difference formulae and central differences formulae in solving interpolation- extrapolation problems in engineering field.
2. Apply Numerical differentiation and integration rules in solving engineering where the handling of numerical methods is inevitable.
3. Recognize the importance of Fourier series & Fourier transforms, difference equations and Z-transforms in the field of signals and systems, communication and network theory signal and image processing, control theory, flow & heat transfer and theory of elasticity.
4. Learn modeling in terms of partial differential equations and also, learn different exact/analytical methods of solving with special emphasis on interpretation of the solution.
5. Interpret the solution of one-dimensional wave, heat and Laplace equations with given initial and boundary conditions in the context of various engineering and technological applications.

Course Title: Network Analysis			
Course Code: P17EE32	**Semester: III**	**L-T-P-H: 3-2-0-5**	**Credits - 4**
Contact period : Lecture: 52 Hrs, Exam 3 Hrs		**Weightage : CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to:

1. To obtain solution to problems on electrical network using different techniques andTheorems and resonance concepts.
2. To determinegraphicalsolutiontoelectricalnetworks using Network Topology.
3. Analyzeand obtain the time domain Response of RLCcircuits for all typesof excitations using Laplace transforms
4. Realization of network functions
5. Driving point immittance functions, Properties, Poles & zeros
6. Providesufficientknowledgetocharacterizetwoportnetworkswithaset of parameters

Relevance of the Course: This course deals with dependent and independent sources, source transformation, theorems, resonance concepts , network topology, to analyze networks under transient condition due to switching and obtain time domain response of RLC circuits with DC and for all typesof excitations using Laplace transforms and have some practical applications to all these chapters.Enablethestudentstoeffectivelyutilizetheknowledgeobtainedinthis course to analyzethe circuit models of electrical machines, power systems,electronic circuit etc.

Course content

UNIT-I

Basic Circuit Concepts: Introduction, Dependent and Independent sources, Source transformation, Star - Delta transformation, Mesh and Super mesh, Nodal &Super node analysis with dependent and independent sources for DC and AC networks. **5Hrs**

Network theorems: Superposition and Thevenin's theorems as applied to DC and AC circuits. **4Hrs**

Resonant circuits: Basic definition, Conditions for Series & Parallel resonance, frequency response, Quality factor, Bandwidth (All derivations and problems are excluded) **1Hr**

Self study: Using MATLAB software, solve and verify the problems on Mesh and Nodal analysis.

UNIT-II

Network Topology: Graph of network, concept of a tree and co-tree, incidence matrix, tie-set and cut-set schedules. Formulation of equilibrium equations in matrix form, solution of resistive networks. **5Hrs**

Harmonic Analysis: Trignometrical Fourier series of non sinusoidal periodic wave forms, Dirichlet condition, wave symmetry, Average value, Effective value of a periodic complex wave, Power and Power factor in single phase circuit with Nonsinusoidal voltages andcurrents. (Exponential Fourier series is excluded). **6Hrs**

Self study: Principle of duality, determination of dual circuits.

UNIT-III

Transient behaviour and Initial and Final Conditions In Networks: Integro-differential equations for networks, Transient behaviour of series R-L, R-C, R-L-C Circuits for DC excitation, Behavior of R, L and C at the instant of switching and at final conditions when the excitation is D.C. Meaning of initial and final conditions in networks. Importance and need for determination of initial conditions. **5Hrs**

Laplace Transform and its applications: Definition of Laplace transforms and it's inverse. Laplace transform of standard signals - step, ramp, impulse, Gate function. Shifting Theorem, Table of useful Laplace transforms. Waveform synthesis of Recurring and Non Recurring signals. Determination of Laplace transform of waveforms using waveform synthesis and gate function. **6Hrs**

Self study: Determination of Laplace transform of waveforms using gate function.

UNIT-IV

Network Analysis Using Laplace Transforms: Analysis of R, L, C, R-L, R-C and R-L-C Circuits to various functions such as step, ramp, impulse.

Concept of transformed impedance and transformed network: Analysis of circuits by using transformed network. Convolution Theorem, Borell's theorem and Duhamel's superposition theorem with Superposition Integral and its applications to networks.**10Hrs**

Self study: Determine the response of the circuits for any arbitrary excitation using Convolution theorem.

UNIT-V

Network Functions: Driving point Immittance functions, Properties, Poles & zeros significance andtime domain response from pole and zero plot. **2Hrs**

Two Port Network Parameters: Network configurations, Z - parameters, Y-parameters, Transmission parameters, h-parameters, Relationship between these parameter sets. Calculation of these parameters for resistive networks. **4Hrs**

Three-Phase Circuits: Numbering and interconnection of three phases. Voltages, Currents and Power in balanced and unbalanced star and delta connected loads. **4Hrs**

Self study: Application of Millman's theorem for the three phase circuits.

Text Books:

1) Roy Choudary, "Networks and system", New age Publication, 2nd edition, 2013

2) VanValkenburg, "Network Analysis", 3rd edition, PHI Learning Private Limited, 2012.

Reference Books:

1) Franklin F.Kuo, Network Analysis & Synthesis, Wiley International

2). Hayt, Kemmerly and Durbin, "Engineering circuit analysis", McGraw-Hill Education, 8th Edition, 2011.

Course Outcomes

After learning all the units of the course, the student is able to:

CO1: To solve problems on electrical network using different techniques and theorems,resonance concepts

CO2: To obtain graphical solution to electrical networks using Network Topology.

CO3: Analyze the network under transient condition due to switching

CO4: Analyze and obtain the time domain response of R, L, C circuits for all types of excitations using Laplace transforms

CO5: Represent the two port networks by Z,Y, ABCD and h Parameters and Assessment of stability of network from network function.

Course Code: P17EE33	**Semester: III**	**L-T-P-H: 4-0-0-4**	**Credits - 4**
Contact period : Lecture: 52Hrs, Exam 3 Hrs		**Weightage : CIE:50; SEE:50**	

Course Learning Objectives (CLO)

At the end of the course the students should be able to:

1. Analyse and design Diode and Transistor circuit such as Clippers, Clampers, Voltage Multipliers and Amplifiers
2. Analyse and design two port hybrid equivalent model for BJT amplifier and Various BJT Oscillator Circuits
3. Understand the effect of negative feedback in transistor amplifier
4. Analyse and design various Power amplifier circuits and study the effect of distortion Power amplifier Analysis of OP-AMP Circuits

Relevance of the Course:

- This course will enable the students to extend their knowledge to analyze and designDiode Circuits, Transistor biasing circuits, BJT amplifiers, Power amplifiers ,Oscillators
- Students are introduced to OP-AMP, and special purpose diodes (zener), feedbacktechniques used in amplifier and representation of transistor circuits by hybridmodel
- Sufficient knowledge is provided so that students will be able to use this course asthe basis for other advanced courses on Electronics.

Continue to enhance oral and written communications skills specifically directedto the practice of electrical engineering

Course content

Unit – I

Diode Circuits: Introduction, Clipping Circuits, Clampers, Voltage multiplier Circuits, Zener Regulator

Transistor Biasing & Amplifiers: Operating point, DC Load line, Voltage divider bias, Classification of Amplifiers, Distortion in Amplifiers, RC Coupled Amplifiers, frequency response of Amplifier. **10Hrs**

Self Study: Clipping at two independent levels.

Unit – II

BJT Transistor Modelling: Introduction, Two port approach & hybrid Model, CB, CE, CC Hybrid equivalent Model, The Important Parameters: *Zi*, *Zo*, *Av*, *Ai*,

BJT Oscillators: Oscillator operation, Phase shift oscillator, Wien bridge oscillator, Tuned oscillators (Hartley &Colpitts) Crystal oscillator. **11Hrs**

Self Study: Piezo electric effect.

Unit – III

FeedBackConcepts: Feedback concept, Loop gain, Feedback connections type, Effect of Negative Feedback on Input Resistance, Output Resistance and Advantages. **10Hrs**

Self Study: GeneralCharacteristics of Negative Feedback Amplifier

Unit – IV

Power Amplifiers: Definitions of Power Amplifiers, Series fed Class A Amplifier, Transformer coupled Class A Amplifier, Transformer coupled Push pull Circuits, Amplifier Distortion, Second Harmonic Distortion. **11Hrs**

Self Study: Applications of Power Amplifier.

Unit –V

Op –Amp: Introduction, Characteristics of Op-Amp, Inverting and non- inverting amplifier, voltage follower Differential Amplifier, Comparators, Schmitt Trigger. R-2R ladder D/A, successive approximation A/D Converter. **10Hr**

Self Study: Sample and Hold Circuit.

Course Code: P17EE34	**Semester: III**	**L-T-P-H: 4-0-0-4**	**Credits - 4**
Contact period : Lecture: 52Hrs, Exam 3 Hrs		**Weightage : CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to

1. To optimize logic expressions using Karnaugh map and Tabular method(L1)
2. To simplify Boolean equation and design combinational circuits with optimal gates (L4)
3. To Analyze the working principles of Flip-Flops and design asynchronous sequential circuits(L4)
4. Understand the basic concepts of Counters and shift registers(L2)
5. Understand the concepts of A/D & D/A converters(L2)

Course Content

Unit – I

Digital Circuits: Data and number systems, Binary representation, Codes: BCD, Octal, Hexadecimal, ASCII, EBDIC, Gray. Signed binary number representation with 1's and 2's complement methods.

Logic operations, axioms & laws of Boolean algebra, Duality, Reduction of Boolean expressions, Boolean functions and their representation, Expansion in SOP & POS form Boolean Expression conversation into logic **10 Hrs**

Self learning: Conversation of Basic gates into Universal

Unit – II

Combinational Logic: Minimization of switching functions using K-Map, 2, 3 & 4 variable, mapping and minimization. Don't care combination solutions. Minimization by Quine - Mclusky method

Combinational Circuits: Half adder, Full adder, Parallel binary adder, Look ahead carry Adder.

Self learning: half & full Subtractor. **10 Hrs**

Unit – III

Encoder: octal to binary, decimal to BCD , Priority encoder: 4 input, decimal to BCD

Decoder:3 to 8 Line, BCD to Decimal ,Multiplexer: 2 input, 4 inputs, 8 inputs. Demultiplexer: 1 to 4 line, 1 to 8 line.

Sequential circuits: Basic stable element, latches, S R latches, Gated S-R latch, Gated D- Latch, SR, D, JK, and T F/Fs, Master- Slave ,SR,D,JK F/Fs, Conversion of SR to JK and SR to **12 Hrs**

Self learning: Conversion of D to SR,T&JKF/Fs .

Unit –IV

Counters: SynchronousCounters, Mealy and Moore models, State M/c equations, construction of state diagrams, Modulo-8 Synchronous counter design

Shift registers: Types of Shift registers - SISO, SIPO, PISO and PIPO, shift left and shift right register **10 Hrs**

Self learning: Asynchronous Counters

Unit –V

D/A and A/D converters: Introduction, R-2R DAC , R-2R Ladder DAC, weighted DAC, Flash Type ADC, Dual slope ADC, Successive Approximation ADC

Logic families: Two input TTL NAND gate, MOS and CMOS circuits & their operation **10 Hrs**

Self learning: ECLcircuit& their operation

Text books:

1). A.Anand Kumar, Fundamentals of Digital Circuits ,PHI,2011
2). Givone,Digital Principles & Design, McGraw Hill,2011

References:

1.Morries Mano, Digital Logic Design, PHI,2012
2. A.K.Maini, Digital Electronics, Wiley,India,2010

Course Outcomes

After learning all the units of the course, the student is able to

CO1: To understand the different switching algebra theorems and apply them for logic functions.
CO2: To define the Karnaugh map for a few variables| & combinational circuits: half adders/subtractors ,encoders/decoders
CO3: To understand the bistable element and the different latches and flipflops.
CO4: To understand sequential circuits, like counters and shift registers
CO5: To understand the concepts of A/D & D/A converters

Course Assessment Matrix (CAM)

Course Title: Data structures with C			
Course Code: P17EE35	**Semester: III**	**L.T.P.H: 4-0-0-4**	**Credits - 4**
Contact Period: Lecture:52 Hrs., Exam 3 Hrs		**Weightage: CIE:50%; SEE:50%**	

Prerequisites: The students should have undergone the course on C- programming so that they should have Basic C programming skills and also should know the Basics of computers.

Course Learning Objectives (CLOs)

This course aims to:

1. Understand and Practice the fundamentals of data structures and their applications essential for Programming/problem solving (L1).
2. Describe, Analyze and Learn the Basic operations on Linear Data Structures: Stack, Queues, Lists (L2).
3. Describe, Analyze and Design the Non-Linear Data Structures: Trees, Graphs (L2, L3).
4. Identify the different tree traversal techniques (L3).
5. Learn the different searching (viz., Binary Search)algorithms (L4).

Relevance of the Course

This course gives the students a basic understanding of the computer software related subject–'Data structures' with examples using Clanguage. It is a very useful basic subject for the students who wants to have a software skill in developing any software programming or software projects of any field. Developinga software involves effective way of handling the data and its storage. Because it consumes lots of memory space and to manipulate such large data, the data should be stored or structured in a useful way.This subject facilitates programmer to implement his project effectively in different data types. Also it covers the knowledge about searching and sorting the data used or stored.

Course Content

Unit – I

Basic Concepts: Basics of Pointers and Dynamic Memory Allocation, MALLOC, CALLOC, REALLOC, FREE, Algorithm Specification, Data Abstraction, recursion

Arrays and Structures: Arrays, Dynamically Allocated Arrays, Structures and Unions.

10 Hrs

Self Studies: writing algorithm and c-program for basic concepts

Unit – II

Stacks and Queues: Stacks, Stacks Using Dynamic Arrays, Queues, Circular Queues Using Dynamic Arrays, Evaluation of Expressions. **10Hrs**

Self Studies: Multiple Stacks & Queue

Unit – III

Linked Lists: Singly Linked lists,Doubly Linked Lists, Circular linked lists, Header node, Linked Stacks and Queues, Polynomials,. **10 Hr**

Self Studies: Programs on linked lists

Unit –IV

Trees: Introduction, Binary Trees, Binary Tree Traversals, Threaded Binary Trees, Heaps, Binary Search Trees, Selection Trees, Forests, Representation of Disjoint Sets**10 Hrs**

Self Studies: Searching and sorting application in Tree

Unit –V

Graphs& Efficient Binary Search Trees: - Definition Graph - representation of graph, The Graph Abstract Data Type**.** AVL Trees, Red-Black Trees, Splay Trees. **12 Hrs**

Self Studies: applications of various Binary search Trees

Text Books:

1. "Fundamentals of Data Structures in C" by: Horowitz and SartazSahni, Anderson-Freed, 2ndEdition,Universities-Press, 2007. Chapters 1, 2.1 to 2.6, 3, 4, 5.1 to 5.3, 5.5 to 5.11, 6.1,10).

2. "Data Structures – A pseudo code Approach with C" – Richard F GilbergandBehrouz A forouzan, 2ndEdition.

Reference Books:

1. Data Structures using C, second edition, Reemathareja, Oxford press.

2. DebasisSamanta: Classic Data Structures, 2nd Edition, PHI, 2009.

Course Outcomes

After learning all the units of the course, the student is able to

CO1: Analysis of basic concepts of data structures

CO2: Design and implement operations on Stacks & Queues

CO3: Develop programs to implement different Linked Lists.

CO4: Analyze the performance ofNon linear Data Structures such as Trees

CO5: Design and implement Binary Search Trees and Graph representation.

Course Assessment Matrix (CAM)

Course Title : Electrical Measurements and Instrumentation			
Course Code : P17EE36	**Semester : III**	**L - T - P : 2- 1 - 0**	**Credits - 3**
Contact Period: Lecture: 40 Hr, Exam: 3 Hr		**Weightage: CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to:

1. To Analyze the principle of operation & working of different Electrical &Electronic instruments (L2).
2. To study the principle of operation & working of different Bridges (L2).
3. To explore different types of standards, methods of calibration used in measurements also to get idea about statistical and regression analysis (L4).
4. To create awareness of different Electrical transducers by means of study about instrumentationused in process engineering (L5).

Relevance of the Course

This course gives the students a basic understanding of working and operation of different instruments. It facilitates the knowledge of different types of standards, methods of calibration used in measurements also to get an idea about statistical and regression analysis. Also it covers the knowledge about operation and major components of electric generating plants. Learning about different transducers by means of study about instrumentation used in process engineering.

Course Content

Unit – I

a)Units and Dimensions: Review of Fundamental and derived units, SI units, Dimensions and dimensional equations, illustrative problems.

b)Introduction to basic measuring concepts: Essential torques, Basic types of instruments, operating principle of Ammeters, voltmeters, wattmeter (LPF & UPF), Energy meter–errors& adjustments, illustrative examples.

Self study: Weston Frequency Meter **8 Hrs**

Unit – II

a) DC Bridges for Measurement of Resistance: Wheatstone bridge - sensitivity analysis & limitations, Kelvin's double bridge, Cable and Earth resistance measurement using Megger, Illustrative examples.

b) AC Bridges for Measurement of Inductance & Capacitance: Anderson's bridge, Schering bridge, Sources and detectors, Shielding of bridges, Illustrative Examples.

Self study: Wagner Earthing device **8 Hrs**

Unit – III

Extension of instrument ranges

a) Shunts and Multipliers, Illustrative examples.

b) Instrument Transformers - Construction and theory, Equations for ratio and phase angle errors of C.T. and P.T (P.T derivations excluded), Turns compensation, Illustrative examples (excluding problems on turns compensation)

Self study: Clamp on meter **8Hrs**

Unit –IV

a) Electronic Instruments: Introduction, True RMS responding voltmeter, Digital Multimeter, Digital voltmeters, Digital Tachometer, Electronic Energy meters

b) Transducers: Classification and selection of transducers, Strain gauges, LVDT, Temperature measurements.

Self study : Transducers in Electronic circuits **8 Hrs**

Unit –V

Oscilloscopes and Display Devices: Front panel details of a typical dual trace oscilloscope, Method of measuring amplitude, Phase, Frequency, Period, Use of Lissajous patterns, Working of a digital storage oscilloscope, X-Y recorders, LED display.

Self study : LCD Display **8 Hrs**

Text Books:

1. A.K.Sawhney, "**Electrical and Electronic Measurements and Instrumentation"**, DhanpatRai&Sons, 19th Revised Edition, 2012

2. David A Bell, "**Electronic Instrumentation and Measurements"**,PHI,2nd Edition, 2012.

Reference Books:

1.Golding and Widdies, "**Electrical Measurements and Measuring Instruments"**, Pitman,5th Edition.

2. Harris, "**Electrical Measurements"**, John Wiley, 2nd Edition.,1995.

Course Outcomes

After learning all the units of the course, the student is able to

CO1: Understand various units and dimensions associated with Electrical Quantities.

CO2: Apply fundamental knowledge of instruments/bridges characteristics for solving engineering problems.

CO3: Understand different types of standards; methods of calibration used in measurements and statistical and regression analysis.

CO4: Understand the principle of operation and working of different electronic instruments.

CO5: Apply the knowledge of different oscilloscopes like CRO, DSO for various applications.

Course Assessment Matrix (CAM)

Course Title: Analog & Digital Electronics Lab			
Course Code: P17EEL37	**Semester: III**	**L-T-P-H: 0-0-3-3**	**Credits – 1.5**
Contact period : Lecture: 50Hrs, Exam 3 Hrs		**Weightage : CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to

1. Students should be able to Diode circuits such as clipping, clamping.
2. Students should be able to Design Transistor amplifier & oscillator circuit.
3. Students should be able to analyze various logic gates , flipflops, counters, shift registers

List of Experiments

1. Design of Diode Clipping circuits
   a. Positive Clipping
   b. Negative Clipping
   c. Double Ended Clipping
2. Design of clamping circuits
   a. Positive clamping
   b. Negative clamping
3. Design of an RC coupled single stage BJT amplifier and determination of the frequency response, input & output impedances
4. Design of BJT R-C phase shift oscillator
5. Design of BJT , Hartley and Colpitts oscillators

6. Design of Inverting and Non-Inverting OP-AMP Circuit
7. Simplification, realization of Boolean expressions using logic gates.
8. Realization of Adder and subtractor using logic gates
   a. Half/Full adder
   b. Half/Full subtractor
9. Realization of Multiplexer and Demultiplexer
10. Truth table verification of flip-flops: D, T, SR & JK
11. Realization of 3 bit counter, Mod N counter, ring/Johnson counter design.
12. Shift register operations: Shift left; Shift right, SIPO, SISO, PISO, PIPO

Self-study Experiment

Course outcome:

CO1. Designing and building circuits using diode and transistor.

CO2. Understanding working of various logic gates, counters, Flip-flops, counters

CO3. Designing own circuit using various analog and digital components.

Text Book:

1. A Practical Handbook to Analog Electronics, Second Edition,New Generation Publishing
2. A Practical Handbook to Digital Electronics, Second Edition,New Generation Publishing

Course Learning Objectives (CLOs)

This course aims:

Toconduct practical experiments on circuits and measuring instruments; Kelvin's Double Bridge, Maxwell L-C Bridge, Schering & De-Sauty's bridges, Single Phase Energy meter, three phase circuit using two wattmeter for star & delta connected loads, Resonance characteristics in series and parallel circuits, KCL & KVL for multiloop electrical circuits, Thevenin's theorem, Maximum Power Transfer Theorem, RC coupled amplifier-Frequency response & determination of bandwidth,

Bridge rectifier, Diode clipping & clamping circuits.

List of Experiments

1. Measurement of low Resistance using Kelvin's Double Bridge.
2. Measurement of inductance using Maxwell L-C Bridge.
3. Measurement of capacitance and dissipation factor by using Schering & De Sauty's bridges.
4. Adjustment and calibration of Single Phase Energy meter
5. Measurement of power in three phase circuit using two wattmeter for star & delta connected loads.
6. Verification of Resonance characteristics in series and parallel circuits using
    a) Conventional method
    b) PSPICE
7. Verification of KCL & KVL for multiloop electrical circuits, with DC & AC sources using PSPICE.
8. Verification of Thevenin's theorem using

a) Conventional method

b) PSPICE

9. Verification of Maximum Power Transfer Theorem using
    a) Conventional method
    b) PSPICE
10. RC coupled amplifier-Frequency response & determination of bandwidth using PSPICE.
11. Bridge rectifier, Diode clipping & clamping circuits using PSPICE.

Self-Study experiment.

Course Outcomes

Student will be able to:

CO1: Learn the measurement of resistance, inductance& capacitances using bridges.

CO2: Conduct experiment on single phase energy meter.

CO3: Learn the measurement of active and reactive power in three phase circuits.

CO4: Determine the resonance characteristics in series and parallel circuits.

CO5: To become familiarwith theorems both in conventional and simulation method.

Course Content

Unit – 1

Sharpen your axe!!

Vedic mathematics:

Viniculum and de- viniculum, subtractions using viniculum .Nikhilum multiplication: For numbers close to base values, multiplication of any two digit numbers or three digits number using criss cross method. Finding the square, square root, cubes , cube root of two digit and three digit numbers quickly. Approximation in multiplication and division. Checking the answer using digital sum method

Self-study Component- Get hands on multiplication tables, increasing the speed in basic arithmetic operations. Classification of numbers.

Percentage calculations and ratio comparison:

Percentage calculations: Percentage rule for calculating , percentage values through additions, percentage– fraction table, approximation in calculating percentages. Application based problems

Ratio comparison: calculations method for ratio compressions: 1. the cross multiplication method, 2. percentage value compression method 3. numerator and denominator percentage change method. Method for calculating the value of percentage change in the ratio. Application based problems.

Self-study Component- Thorough with fractions and decimal values.Applications of tabulated fractions.Product of means and extremes. 8 Hrs

Unit – 2

Analytical Reasoning 1: series

Number series: Standard patterns of number series, pure series: perfect square, square cube,

prime, combination of this series. Difference series, ratio series, mixed series, geometric series, two-tier arithmetic series, three-tier arithmetic series, change in the order for difference series, change in the order for ratio series, sample company questions.

Letter series: Alphabet and Alphanumeric series, finding the missing term based on logic learnt in number series module, continuous pattern series, correspondence series. sample company questions.

Picture series : image analysis, addition deletion rotation or modification of lines or shapes. Understanding the symmetry of the image.Mirror image analysis.sample company questions.

Self-study Component- Basic knowledge of letter positions, Different number series for example – even, odd, prime, composite etc 6 Hrs

Unit – 3

Number system:

Introduction, **Integers:** Remainder zero concept, Odd and Even Integers, Negative and positive integers, power number a^x, properties of a perfect square number. **Prime number:** General method to identify the prime number, properties of prime numbers. Euler's number. **Factorial number:** Wilson's theorem, important results on factorial. **Divisor:** number of divisors, sum of divisors, number expressed as the product of two factors.

Divisibility rules: divisibility of a whole number by a whole number, divisibility of an expression by an expression. **Modulus concept:** divisibility rules in modulus, rules of operations in modulus. **Finding one remainder:** One divisor, remainder of $(a^n - b^n)$, remainder for more than one divisor.

Unit digit: Concept of power cycle, finding last two digits**.** Number of trailing zeroes.

Self-study Component-Basic arithmetic operations, knowledge about quotient and remainders, multiples and factors. 6 Hrs

Unit – 4

Simple equations, Ratio Proportions and Variations:

Simple equations: Linear equations-Linear equations in one variable, linear equation in two variables, Different methods of solving linear equations in two variables– Method of elimination, Method of substitution, Method of cross multiplication. Format of equations that can be converted to linear equations, Linear equations of three variables, Inequalities and its properties.Advanced problems on Simple equations.Age problems.

Ratio Proportions and Variations: Understanding the meaning and difference between ratio, proportion and variation. Properties of ratio, Comparison of more than two quantities, Proportion, Properties of proportion - Componendo, Dividendo, Invertendo, Alternendo.Continued proportion, Mean proportion. Variation - Direct variation, Indirect variation, Joint variation, Short cut methods to solve problems on variation.

Self-study Component-Knowledge about factors, types of factors. Splitting the middle term rule, formula rule. 6 Hrs

Unit – 5

Building the fundamentals of logical reasoning:

Arrangement:

Approach to tackle questions, Different types of arrangement– Linear arrangement, Circular arrangement.Selection, Double line map. Possible ways of arrangement– Words or numbers, left side only, right side only, left right alternate, increasing or decreasing order, interchange vs push, Strategy for solutions– some tips for quick answers, general strategy.

Directions :

Basics. Pythagorean theorem, Pythagorean triplets, Solving problems for practice.

Blood relations :

Some typical relations that we come across, family tree, Structuring the given problem step by step. Suggested methods– Backtracking, drawing family tree.Problems on blood relations and professions.

Self-study Component-Basic knowledge of directions, Pythagoras theorem.Logical reasoning skills, Relations, Family tree. 6 Hrs

Reference Books:

1. The Trachtenberg speed system of basic mathematics, published by Rupa publications.
2. CAT Mathematics by AbhijithGuha. published by PHI learning private limited.
3. Quantitative aptitude by Dr. R. S Agarwal, published by S.Chand private limited.
4. Verbal reasoning by Dr. R. S Agarwal , published by S. Chand private limited.
5. Quantitative aptitude for CAT by Arun Sharma, published by McGraw Hill publication.
6. Analytical reasoning by M.K Pandey BSC PUBLISHING.CO.PVT.LTD

Course Outcomes

After learning all the units of the course, the student is able to:

1. Solve mathematical calculations in less duration compared to the conventional method.L1
2. Give examples for AP, GP and HP and differentiate between them. L1
3. Apply divisibility rules , power cycle method and evaluate the significance of the number system module. L2
4. Point out the errors in the problems concerning inequalities and solve simple equations and problems based on ratio, proportion and variation. L5
5. Solve the problems based on blood relations, directions and arrangement. L4

Course Code : P17MADIP31	**Semester : 3**	**L:T:P:H : 4:0:0:4**	**Credits: 0**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr	**Weightage: CIE:50%, SEE:50%**		

Course Content

Unit -1

Complex Trigonometry: Complex Numbers: Definitions & properties. Modulus and amplitude of a complex number, Argand's diagram, De-Moivre's theorem (without proof). Roots of complex number - Simple problems.

Vector Algebra: Scalar and vectors.Vectors addition and subtraction. Multiplication of vectors(Dot and Cross products). Scalar and vector triple products-simple problems.**12 Hrs**

UNIT -2

Differential Calculus: Review of successive differentiation. Formulae for n^{th} derivatives of standard functions- Liebnitz'stheorem(without proof). Polar curves –angle between the radius vector and the tangent pedal equation- Problems. Maclaurin's series expansions-Illustrative examples. Partial Differentiation : Euler's theorem for homogeneous functions of two variables. Total derivatives-differentiation of composite and implicit function.Application to Jacobians, errors & approximations. **10 Hrs**

UNIT –3

Integral Calculus: Statement of reduction formulae for $sin^n x$, $cos^n x$, *and* $sin^m x cos^m x$ and evaluation of these with standard limits-Examples. Differentiation under integral sign(Integrals with constants limits)-Simple problems.Applications of integration to area, length of a given curve, volume and surface area of solids of revolution. **10 Hrs**

UNIT-4

Vector Differentiation: Differentiation of vector functions. Velocity and acceleration of a particle moving on a space curve. Scalar and vector point functions. Gradient, Divergence, Curl and Laplacian (Definitions only).Solenoidal and irrotational vector fields-Problems. **10 Hrs**

UNIT-5

Ordinary differential equations (ODE's): Introduction-solutions of first order and first degree differential equations: homogeneous**,** exact, linear differential equations of order one and equations reducible to above types. Applications of first order and first degree ODE's - Orthogonal trajectories of cartesian and polar curves. Newton's law of cooling, R-L circuits-Simple illustrative examples from engineering field. **10 Hrs**

Text Book:
1. B.S.Grewal: Higher Engineering Mathematics, Khanna Publishers, New Delhi, 42nd Ed. 2012.

Reference Books :
1.E. Kreyszig: Advanced Engineering Mathematics, John Wiley & Sons, 6th Ed., 2007.
2.N.P.Bali and Manish Goyal: Engineering Mathematics, Laxmi Publishers, 7th Ed., 2007.

Course Title : Engineering Mathematics-IV			
Course Code : P17MAT41	**Semester : 4**	**L:T:P:H : 3:2:0:5**	**Credits: 4**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr		**Weightage: CIE:50%, SEE:50%**	

Course Content

Unit-1

Numerical Methods-II: Solution of algebraic and transcendental equations: Bisection method, Regula-Falsi& Newton–Raphson method. Fixed point iteration method: Aitken's Δ^2- process - Illustrative examples only.

Numerical solution of ordinary differential equations (ODE's): Numerical solutions of ODE's of first order first degree – Introduction. Taylor's series method.Modified Euler's method, Runge - Kutta method of IV order, Milne's and Adams predictor & corrector methods (All formulae without proof). 10 Hrs

Self-Study Component: Solution of second order ordinary differential equations using Rung-Kutta methods. Solution of first order simultaneous differential equations.

Unit-2

Linear Algebra-II: Introduction to vector spaces – subspaces, Linear combination of vectors, linearly independent/dependent sets; Bases and dimension. Linear transformation - Rank nullity theorem (Statement only). Change of basis. Matrix of linear transformations. (No proof for theorems/properties) - Illustrative examples from engineering field.

Numerical methods for system of linear equations- Gauss-Jacobi and Gauss- Seidel iterative methods.Relaxation methods**.** Determination of largest eigen value and corresponding eigen vector by power method. **10 Hrs**

Self-Study Component: Ramanujan's Method to find the smallest root of a polynomial**.**

Unit-3

Complex Analysis: Introduction to functions of complex variables. Definitions- limit, continuity and differentiability. Analytic functions. Cauchy–Riemann equations in Cartesian and polar forms problems on properties of analytic functions (No proof). Construction of analytic function: Milne-Thomson method. Conformal transformation–Definitions. Discussion of transformations : $w=z^2$, $w=e^z$, $w = z + 1/z \ (z \neq 0)$. Bilinear transformations.

Complex integration: complex line integrals. Cauchy theorem, Cauchy integral formula.Taylor's and Laurent's series (Statements only).Singularities, poles and residues.Cauchy residue theorem (statement only).Simple illustrative examples **11 Hrs**

Self-Study Component: Derivation of Cauchy- Riemann equation in Cartesian and polar form. Derivation of Cauchy theorem, Cauchy integral formula and Cauchy's residue theorem.

Unit-4

Statistics: Brief review of measures of central tendency and dispersion. Moments, skewness and kurtosis. Curve fitting-least square method $: y = a + bx; y = ax^b, y = ab^x \text{ and } y = ax^2 + bx + c.$ Prof. Karl Pearson's coefficient of correlation and linesofregression

ProbabilityTheory: Brief review of elementary probability theory. Random variables (discrete and continuous)-Introduction to probability distributions- probability mass/density functions and cumulative probability density functions – Illustrative examples.Discrete probability distributions- Binomial and Poisson's distributions; Continuous probability distributions - exponential and normal distributions. (No derivation of mean and variance). Illustrative examples from engineering and industrial fields. **11 Hrs**

Self-Study Component: Basic definitions of probability and problems up to Bayes' theorem. To fit curves of the type $: y = ae^{bx}$, Derivation of Mean and SD of Binomial & Poisson distribution**.**

Unit-5

Joint probability distributions and Markov chains:

Series solutions of ODE's and special functions: Power series solution of a second order ODE, Series solution-Frobenius method. Series solution leading to $J_n(x)$- Bessel's function of first kind. Expansions for $J_{1/2}(x) \text{and } J_{-1/2}(x)$. -simple related examples.Series solutions of Legendre's differential equation leading to $P_n(x)$-Legendre's polynomials. Rodrigues's formula (No Proof)- simple illustrative examples. 10 Hours

Self-Study Component: Basics of Series solutions of ODE's; analytic, singular point and basic recurrence relations.

4. Seymour Lipschutz : Probability:-, Schaum's outline series, McGraw-Hill Pub., 2nd Ed, 2002.
5. Higher Engineering Mathematics:- B.V. RAMANA ,McGraw Hill Education , 2007

Note: - Eachunit contains ***two*** full questions of ***20 marks*** each. Students are required to Answer ***five*** full questions choosing at least ***one*** question from each unit.

Course Outcomes

After learning all the units of the course, the student is able to;

1. Apply the familiarity of numerical methods for solving algebraic and transcendental equations and demonstrate single-step and multi-step numerical methods for solving ordinary differential equations and interpret the solution in engineering applications.
2. Describe the concept of vector space, subspace, basis, dimension and their practical utility in matrix of linear transformations required in the area of graphics, analysis ofgraphs, internet search, machine learning and scientific computing etc. And, understand the procedure of numerically solving large systems of linear algebraic

equations and obtaining eigen value and eigen vector corresponding to a large eigen vector, with the aid of standard methods of numerical linear algebra

3. Explain the concept of analyticity and potential fields through complex functional /potential, conformal transformations and interpret the solution in fluid flow and electromagnetic problems and describe the process of complex integration and learn series representation of a function of complex variables, residues and poles.
4. Apply the knowledge of statistics in interpretation the data, fitting of a linear and non-linear curves of best fit for experimental data arising in engineering calculations and analyze the same by expressing in the form of regression lines. And, Illustrate the concept of random variables (discrete/continuous) and related probability distributions and use them in analyzing and solving engineering problems associated with probability model.
5. Define the concept of joint probability of two random variables and apply the knowledge of joint probability distribution in interpreting data through statistical measure. and, analyze the notion of higher transition probabilities, the Markov chain and queuing models arising in engineering problems for feasible random events.
   Obtain series solution of essential ODE's such as Bessel's and Legendre's differential equations and understand their scientific/engineering utility

Course Title : Signals & Systems			
Course Code : P17EE42	**Semester : IV**	**L - T - P H: 3- 2 - 0 -5**	**Credits: 4**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr		**Weightage: CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to

1.Analyze the types of signals, operations which can be performed on signals and properties of systems.
2.Describe the concept of impulse response.
3.Use the knowledge of impulse response to solve differential and difference equations
4.Describe the concept of discrete-time Fourier series (DTFS).
5.Explain the concept of Z-Transform.

Course Content

UNIT-I

Introduction: Definitions of signals and systems, Classification of signals, Basic operations on signals, Systems viewed as interconnections of operations on signals, Properties of systems.
Self learning: Elementary signals **10 Hrs**

Unit – II

Time-domain representations for LTI systems:Impulse response, representation of signals using impulses,Convolution–impulse response representation for LTI systems.Properties of impulse response representation for LTI systems. **10Hrs**
Self learning: Properties of convolution

Unit – III

Time-domain representations for LTI systems – Differential and difference equationRepresentations, Block diagram representations. .
Fourier Representation of Signals: Introduction to Fourier representation of signals, Introduction to continuous time Fourier series
Self learning: discrete time Fourier series **10 Hrs**

Unit – IV

Fourier representation for signals: Introduction to Discrete time Fourier transform and continuous time Fourier transform. Properties of Discrete time Fourier transform .
Applications of Fourier representations: Introduction, Frequency response of LTI systems.
Self learning: Properties of continuous time Fourier transform **10 Hrs**

Unit – V

Z-Transforms: Introduction, Definition of the z-transform and its inverse, Region of Convergence, Properties of z-transforms, z-transform Inversions, z-Transform analysis of LTI Systems.
Self learning: Initial and final value theorem **12Hrs**

Text Book:

1) Simon Haykin and Barry Van Veen, "Signals and Systems", John Wiley & Sons, Second edition, 2008.

3. D. Ganesh Rao and SatishTunga, "Signals and Systems: A Simplified Approach", Sanguine Technical Publishers.

Course Outcomes

After learning all the units of the course, the student is able to

1. Understand the classification of signals, relate between elementary signalsand identify the properties of a system.
2. Perform convolution operation on continuous and discrete time signals.apply the properties of impulse response representation.
3. Solve difference and differential equations and represent them as block diagrams.
4. Apply the properties of DTFS and DTFT to Discrete and continuous time signals.
5. Solve difference equations using Z-transforms

Course Title: Electrical Machines - I			
Course Code: P17EE43	**Semester: IV**	**L-T-P-H: 4-0-0-4**	**Credits - 4**
Contact period : Lecture: 52Hrs, Exam 3 Hrs		**Weightage : CIE:50 SEE:50**	

Course Learning Objectives (CLOs)

This course aims to

1. Analyze the theory, construction, classifications and working principle of single phase, three phase transformers and single phase, three phases Induction motors.
2. Understand to carryout different tests on single phase, three phase transformers and single phase, three phase Induction motors.
3. To draw equivalent circuit, circle diagram to know the performance of three phase induction motor.
4. To find the efficiency and regulation of single phase transformers. Practical applications and to select the machine for various applications.

Course Content

Unit – I

Transformers: Principle of operation, constructional details of shell type and core type single phase transformers. Description of Power transformers, distribution transformers, constant voltage transformers.

Analysis and Performance of Single Phase Transformers: Equation for EMF induced in the two windings. Voltage & Current transformation ratio, Concept of Ideal transformers, transformer on no-load and load with phasor diagrams. Concept of M.M.F. balance in transformers, Equivalent circuit of a transformer. Auto transformer, saving of copper in an auto trans-former, Advantages & Disadvantages, Applications **10Hrs**

Self Study: Instrument Transformers

Unit – II

Testing of Transformers:O.C. & S.C. test, pre-determination of efficiency and regulation, determination of equivalent circuit parameters. All day efficiency, Sumpner's test. Parallel operation: need, conditions for parallel operation & load sharing. **10 Hrs**

Self Study: Polarity Test

Unit – III

Three phase Transformer: Three-Phase transformer connections: delta-delta, delta-star, star-delta, star-star & open delta. Single phase transformers for three phase operation. Scott connection for three phase to two phase conversion. Labeling of three phase transformer terminals., Parallel operation. Three winding transformer & its equivalent circuit, determination of parameters of three winding transformer, voltage regulation of three winding transformers. **10 Hrs**

Self Study: Tap changing transformers

Unit –IV

Three Phase Induction Machines: Basic **c**oncepts of rotating magnetic field. Operating principle, construction, types: Squirrel-cage, Slip-ring.

Analysis of Three Phase Induction Motor: Induction motor operation on no-load and load conditions. Torque-slip characteristics of a three phase induction motor Need for starter. Qualitative analysis of DOL, Star-Delta, auto-transformer starting, Speed control by voltage, frequency, and rotor resistance methods. **10 Hrs**

Self Study: Schrage Motor

Unit –V

Performance of Three Phase Induction Machines: No-load and blocked rotor tests. Performance evaluation - output power, torque, and efficiency, current and power factor using Circle diagram. Losses and efficiency in an induction motor. Cogging and crawling.

Single-phase Induction Motor: Principle of operation, production of rotating field double revolving field theory, determination of equivalent circuit parameters Types of single phase induction motors: split-phase, capacitor start, shaded pole motors, universal motors. **10Hrs**

Self Study: Induction generator

Text Books:

Course Outcomes

After learning all the units of the course, the student is able to

CO1: Understand the basic operation and construction of different types oftransformers

CO2: Analyze the various performance parameters of a single phase andthree phase transformer

CO3: Understand the various tests to be conducted on a transformer

CO4: Analyze the construction, operation and performance of various types ofsingle phase induction motors

CO5: Analyze the construction, operation and performance of various types ofthree phase induction motors

Course Assessment Matrix (CAM)

Course Outcome (CO)		Program Outcome													
		PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12	PSO1	PSO2
Understand the basic operation and construction of different types of transformers	L2	**1**	**1**	**2**	-	-	-	**1**	-	-	-	**1**			
Analyze the various performance parameters of a single phase and three phase transformer	L4	**3**	**2**	**2**	-	-	-	**2**	-	-	-	-			
Understand the various tests to be conducted on a transformer	L2	**1**	**2**	**1**	-	-	-	-	-	-	-	-			
Analyse the construction, operation and performance of various types of single phase induction motors	L4	**3**	**2**	**2**	-	-	-	**1**	-	-	-	-			
Analyse the construction, operation and performance of various types of three phase induction motors	L4	**3**	**2**	**2**	-	-	-	**1**	-	-	-	-

Course Title: Electromagnetic Theory			
Course Code: P17EE44	**Semester: IV**	**L-T-P-H: 3-2-0-5**	**Credits - 4**
Contact period : Lecture: 50Hrs, Exam 3 Hrs		**Weightage : CIE:50; SEE:50**	

Course Learning Objectives (CLOs)

This course aims to:

1. Understand the basic conceptsof electric and magnetic fields.
2. Understand the concept of conductors, dielectrics, inductance and capacitance
3. Gain knowledge on the nature of magnetic force, magnetic materials.
4. Understand the concept of staticand time varyingfields.

Course Content

Unit – I

Time Invariant Electric Fields (Electrostatics): Brief introduction to vector analysis, Experimental law of coulomb, electric field intensity, field due to continuous volume charge distribution, field due to line charge and field of a sheet of charge,.

Electric flux density, Gauss law and Divergence: Electric flux density, Gauss law,

application of Gauss law for some symmetrical charge distributions, application of Gauss law for differential volume element, divergence, max well's first equation in electrostatics, and the divergence theorem. **10Hrs**

Self Study: Field lines and sketches, vector operator (delta)

Unit – II

Energy and Potential: Energy expended in moving a point charge in an electric field, the line integral, potential difference and potential, potential field of a point charge, potential field of system of charges- conservative property, potential gradient, the dipole, energy density in the electrostatic field.

Poisson's and Laplace Equations: The derivation of Poisson's and Laplace equation, uniqueness theorem, examples on the solution of Laplace and Poisson's equations. **10Hrs**

Self Study: Properties of gradient of a scalar and Applications of Laplace's equation (Problems are excluded).

Unit – III

Current and Conductors: Current and current density, continuity of current, metallic conductors, conductor properties and boundary conditions**.**

Dielectric and Capacitance: The nature of dielectrics materials, boundary conditions for perfect dielectrics materials, capacitance, capacitance examples, and current analogies.**10 Hrs**

Self Study: Equation for Relaxation time, equation for Steady current and Boundary conditions between conductor and dielectrics.

Unit – IV

Time Invariant Magnetic Fields (Magnetostatics): Magnetic field and its properties**,** Biot-Savart's Law, Applications of Biot-Savart's Law, Ampere's Circuital Law, Applications of Ampere's Circuital Law, Curl,Stroke's theorem, magnetic flux and magnetic flux density, scalar and vector magnetic potentials. **10 Hrs**

Self study: Properties of curl, physical significance of curl including types of fields

Unit – V

Time variant magnetic fields : Faraday's Law, Emf induced by changing field within a stationary path (transformer Emf), Emf induced in a moving conductor within a constant field (motional or generator Emf).

Magnetic Forces, Materials and Inductance: Force on a moving charge, force on a differential current element, force between differential current elements, magnetic boundary conditions, Inductance, Mutual inductance **10 Hrs**

Self Study: Magnetic circuits, Magnetic dipole moment

Text Books:

1) William H Hayt Jr. andJohn A Buck, Engineering Electromagnetic, Tata McGraw-Hill, 7TH Edition 2005
2) Stuart M. Wentworth,'Applied Electromagnetics: Early Transmission LineApproach',JohnWiley,2007.

Reference Book:

1). John Krauss and Daniel A Fleisch, Electromagnetics with Applications, McGraw-Hill, 5th Edition 2006.

Course Outcomes

After learning all the units of the course, the student are able to:

1.Determine the electric, magnetic fields, energy stored due to specified charge and current distribution.

2.Perform analysis of materials in the presence of fields for simple geometries.

3.Apply the appropriate electric and magnetic field boundary conditions for a given problem involving their usage.

4.Work with Maxwell's equation in differential and integral forms for the solution of appropriate problems involving static as well as time varying fields.

5.Solve problems involving one dimensional Poisson's and Laplace's equations.

Course Assessment Matrix (CAM)

Course Title: Microcontrollers			
Course Code: P17EE45	**Semester: IV**	**L-T-P-H: 4-0-0-4**	**Credits - 4**
Contact period : Lecture: 52Hrs, Exam 3 Hrs		**Weightage: CIE:50%; SEE:50%**	

Course Learning Objectives (CLOs):

This course aims to:

1. Explain the difference between Microprocessor & Microcontrollers with their evolution and the choice of a microcontroller.
2. Understanding the basic architectures based on memory and instructions set.
3. Describe and analyze the different types of addressing modes used to accessthe data both from Internal and External memory.
4. Describe and analyze the various types of instructions sets that are used to perform the data related operations.
5. Explain and analyze the various conditional and unconditional JUMP and CALL instructions and their relative range of jump.
6. Describe and analyze the timer/counter operation with various modes
7. Explain and analyze the various modes of serial communications and interfacing circuits in order to communicate with external world.
8. Write ALP for data operation, timer/counter, interrupt, serial communication and interfacing circuits with external world.

Relevance of the course:
This course deals with the evolution of Microcontrollers and their application with the architecture of 8051 they understand and the implementation of instruction sets to write programs for arithmetic, logic and sorting of the numbers. They can also interface microcontrollers with external world and operate them.

Course content

Unit-I

Microprocessors and Microcontroller. Introduction - Microprocessors and Micro controllers, A Microprocessors survey. RISC & CISC CPU Architectures, Harvard & Von Neumann CPU architecture.

8051 Architecture: Introduction, 8051 Micro controller Hardware, Input /output pins, Ports and circuits, Counter and Timers, Serial data input / output **10Hrs**

Self study: External memory

Unit-II

Addressing Modes: Introduction, Addressing modes. Data moves & Logical Operations: External data moves, Code Memory, Read only data moves / Data exchanges, Byte level logical operations, Bit level logical operations, Rotate and Swap operations. Incrementing and decrementing. **10Hrs**

Self study: Stack operation

Unit-III

Arithmetic Operation: Addition, Subtraction, Multiplication and division, Decimal arithmetic, Programs.

Jump and Call Instruction: JUMP and CALL program range, Jumps, Calls and Subroutines programs. **12Hrs**

Self study: Programs using subroutines

Unit- IV

Timer / Counter programming in 8051: Programming 8051 Timers, Counter Programming, Programming timers 0 and 1 in assembly language **10Hrs**

Self study: Counter/Timer programming in C

Unit- V

Interrupts Programming: More detail on Interrupts, 8051 interrupts, Programming Timer Interrupts, Programming external Hardware Interrupts, Programming the Serial Communication Interrupts, Interrupt Priority in the 8051/52, interrupt programming in assembly language.

8051 Serial Communication: Basics of serial Communication, 8051 connecting to RS-232, 8051 Serial communication programming, Programming the second serial port, Serial port programming in assembly language. **10 Hrs**

Self study: Serial port programming in C

Text Books :

1. Kenneth J. Ayala : "The 8051 Microcontroller Architecture, Programming & Applications" 2nd Edition, Penram International, 1996/ Thomason Learning 2005.
2. Muhammad Ali Mazidi and Janaice Gillespie Mazidi and Roollin D. Mckinlay" The 8051 Micro controller and Embedded Systems- using assembly and C " , Person Education, 2nd Edition 2006

Reference Book:

1. Predko "Programming and Customising the 8051 Micro controller" TMH 3rd Edition 2007
2. Ajaya V Deshmukh "Microcontrollers- Theory and applications", TMH 3rd Edition 2005
3. Rajkamal "Microcontrollers: Architecture, Programming, interfacing and system design", Person education, 4th Edition 2005

Course outcomes:

After learning all the units of the course, the student should able to

CO1: Explain the various types of microcontrollers with their evolution andcompare them based on the architecture.

CO2: Describe the different types of addressing modes used to access the data both from internal and External memory.

CO3: Describe and analyze the various types of instructions sets thatare used to perform the data related operations

CO4: Explain and analyze the various conditional and unconditional JUMP and CALLinstructions and their relative range of jump.

CO5: Describe and analyze the timer/counter and interrupt access with their basic modes

CO6: Explain and analyze the interfacing circuits in order to serially communicate with external world.

CO7: Able to write ALP for data operation, timer/counter, interrupt andinterfacing with external world.

Course Assessment Matrix (CAM)

Course Outcome – CO			Program Outcome

Course Title: Power Plant Engineering			
Course Code : P17EE46	**Semester : IV**	**L-T-P-H: 4-0-0-4**	**Credits – 3**
Contact Period: Lecture: 40 Hr. Exam 3 Hr		**Weightage : CIE:50: SEE:50**	

Course Learning Objectives (CLOs)

1. Understand the conceptual working principles of conventional sources of electric power generation.
2. Explain the detail description of hydroelectric plants, nuclear power plants and gas power plants.
3. Analyze the power generation using non-conventional energy sources
4. Understand the concept of load curves and different tariff
5. Understand the concept grounding and power factor

Unit – I

Hydro Electric Power Generation: Selection of site, Classification of site, General arrangement and operation. Power station structure & control.

Thermal Power Generation: Introduction, Main parts, Working, Plant layout, Coal handling system, Ash disposal schemes. **8Hrs**

Self study: Principle of working of a Hydro – Electric Turbines

Unit – II

Nuclear Power Station: Introduction, Selection of site, Cost, Components, Reactors, Description of fuel sources, Adverse effects, Safety of nuclear power station, Disposal schemes of nuclear waste.

Diesel Electric Station: Introduction, Types of plants, Components, Plant layout and maintenance, Choice and characteristics **8Hrs**

Self study: Nuclear materials

Unit – III

Generation Using Non-Conventional Energy Sources: Solar, Wind, Tidal, Geo-thermal

Co-Generation: Mini, Micro and Bio fuel Generation, Distributed generation. **8Hrs**

Self study: Gas turbine plants

Unit – IV

Economic Aspects: Introduction, Terms commonly used in system operations: Diversity factor, Load factor, Plant capacity factor, Plant use factor, Plant utilization factor, Loss factor. Load duration curve, Power factor improvement and Tariffs. **8Hrs**

Self study: Load curve and load duration curve and its uses

Unit – V

Interconnected stations: necessity of phase angle control, load sharing and transfer of load between
stations, Power limit of interconnectors.

Grounding Systems: Introduction, Resistance grounding system, Neutral grounding, Ungrounded system, Resonant grounding, Solid grounding, Reactance grounding, Earthing transformer, Neutral grounding transformer. **8Hrs**

Self study: Parallel operation of interconnectors

Text Book:

1. S. M. Singh, "Electrical power generation, transmission and distribution"-Prentice hall of India, New Delhi, 2nd 2008.

Understand the concept of grounding and power factor improvement		2	1	3			2								
1-Low, 2-Modertae, 3-High															

Course Title: Electrical Machines Lab-I			
Course Code: P17EEL47	**Semester: IV**	**L-T-P-H: 0-0-3-3**	**Credits – 1.5**
Contact period : Lecture: 36Hrs, Exam		**Weightage : CIE:50%; SEE:50%**	

Course Learning Objectives (CLOs)

This course aims to

1. Students should be able to study OC and SC tests on single phase Transformer.
2. Students should be able to determine the performance characteristics of single phase induction motor.
3. Students should be able to study how the load can be shared between two transformers.

List of Experiments

1. OC & SC tests on Single Phase transformer: Pre-determination of efficiency & regulation.
2. Sumpner's test on single phase transformers.
3. Parallel operation of single phase transformers.
4. Polarity test, connection of three single phase transformers in star-delta and determination of efficiency & regulation.
5. Scott connection for balanced & unbalanced load.
6. Load test on single phase Induction motor.
7. Load test on three phase induction motor.
8. Performance evaluation of three phase induction Motor using Circle diagram.
9. Speed control of three phase induction motor by Rotor resistance control.
10. Load test on three phase Induction generator.

Self-Study Experiments

Course outcomes:

After learning all the units of the course, the student should able to

1. Conduct different tests on single phase transformer.
2. Determine the performance characteristics of single phase induction motor.
3. Know how load can be shared between two transformers

Course Articulation Matrix (CAM)

Course Outcomes:	Program Outcomes:													
	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12	PSO1	PSO2
Conduct different tests on single phase transformer.	**3**	**1**	**2**											
Determine the performance characteristics of single phase induction motor.		**2**	**1**											
Know how load can be shared between two transformers	**2**	**1**												
1 – Low, 2 – Moderate and 3 – High														

Course Title: Microcontroller Lab			
Course Code: P17EEL48	**Semester: IV**	**L-T-P-H: 0-0-3-3**	**Credits – 1.5**

Course Learning Objectives (CLOs)

This course aims to:

1. To provide practical knowledge about writing program in assembly level language and executing programs using Microcontroller kit.
2. To provide practical knowledge about interfacing the hardware to Microcontroller kit

List of Experiments

1. Addition, Subtraction, Multiplication & Division of 8-bit data.
2. Addition &Subtraction of 16 bit data
3. To find the largest and smallest of 8-bit number in a given array
4. Arranging numbers in Ascending & Descending order in a given array
5. Code conversions: Binary to gray, ASCII to BCD, Hexadecimal to decimal and vice versa.
6. To find the number of 1's & 0's of a given 8 bit number.
7. To determine +ve and –ve number in an array
8. Addition of n-8 bit numbers stored in external memory
9. Data movement with and without overlapping
10. Sorting of even and odd numbers separately
11. DC Motor interface with microcontroller
12. Stepper Motor interface with microcontroller
13. Elevator interface with microcontroller

Self-Study Experiments

Course outcome:

CO3: Writing program for Addition, Subtraction, Multiplication &Division of 8-bit data & 16 bit number using assembly level language

CO4: Writing an assembly level program for data transfer.

CO5: Writing an assembly level program to arrange the numbers even or odd ; to sort in ascending or descending order ; finding 0's & 1's and positive & negative number.

CO6: Writing an assembly level program code conversion.

CO7: Writing a program for Hardware interfacing to Microcontroller kit.

			PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12
1	Writing program for Addition, Subtraction, Multiplication & Division of 8-bit data & 16 bit number using assembly level language	L2	2	2	1	_	3	_	_	1	-	2	_	
2	Writing an assembly level program for data transfer	L2	1	3	2	_	2	-	_	_	_	_	_	
3	Writing an assembly level program to arrange the numbers even or odd ; to sort in ascending or descending order ; finding 0's & 1's and positive & negative number.	L2	1	3	2	_	2	_	_	_	-	_	_	
4	Writing an assembly level program code conversion.	L3	2	2	1	_	3	_	_	_	-	_	_	
5	Writing a program for Hardware interfacing to Microcontroller kit.	L4	2	2	3	_	-	_	-	1	-	_	3	
Low, M-Moderate, H-High.														

Course Title : Aptitude and Reasoning Development - INTERMEDIATE (ARDI)			
Course Code : P17HU49	**Semester : 4**	**L :T:P:H : 2:0:0:2**	**Credits: 1**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr		**Weightage: CIE:50%, SEE:50%**	

Course Content

Unit – 1

Time, Speed and Distance: Concept of motion and mathematical representation of motion, The rule of proportionality, Conversion between kmph to m/s, Concept of average speed and its application in different scenarios, Relative speed– Importance, application and observation in day to day life, same direction and opposite direction, An application of allegation in Time speed and distance, Trains– Different scenarios. Boats and streams– resultant speed, upstream and downstream concept.Circular motion– Two or three bodies meeting at the starting point or anywhere in the track.Races– Concept of head start, solving problems under different constraints.Application of solving problems under Clocks.

Self-study Component- Basic relation between the 3 different quantities.Conversions between different units of measurement.Speed and velocity.

6 Hours

Unit-2

Cubes, Clocks & Calendars: Cubes: Number of faces, vertices and edges. Colored cubes.Number of colored faces and the formulae to find-out the same.Problems on cubes.

Clocks & Calendars: Minute spaces. Hour hand and minute hand.Angle between the hands.Relative speed.Faulty clocks. Time gained or lost by the clock. Odd days.Leap year.Ordinary year.Counting of odd days.Problems on clocks and calendars.

Self-study Component- Knowledge about shapes and dimensions, Area and volume.Leap year, number of days.Important dates. 8 Hours

Unit-3

Set theory and Venn diagram: Set builder form, Tabular form, Venn diagram, Types of sets, Operation of sets using venn diagram, Important properties, Algebraic laws of sets, Maxima and minima in set operation, Venn diagram for four sets.

Syllogism: Meaning of syllogisms, Format of problems and standard qualifiers, Concept of distribution, Standard question pattern, Application of venn diagram to solve problems.

Logical Venn diagrams: Analysis of the given problem and solve it.

Self-study Component- Basics about sets, operations using venn diagram. Basic applications. 6 Hours

Unit-4

Geometry and Mensuration: Theory, straight lines, triangles– theorems, area, lines inside triangle and geometric centre, Special property of an equilateral triangle, Application of Pythagoras theorem, Congruency and similarity of triangles, Basic proportionality theorem, Polygons, Quadrilaterals, Trapezium, Parallelogram, Rectangle, Rhombus, Square, Division of polygons, Circumscribed and Inscribed polygons, Concyclic points concept, Cyclic quadrilateral, Circle– Radius, Area and perimeter, Arc, Chord, Sector, Segment, Tangent, Secant, Area of common region Solid figures– Introduction, Classification of a solid, Net of a solid, Cuboid, Cube, Right cylinder, Pyramid– right pyramid, triangular pyramid, Cone– frustum of a cone, Sphere, Combination of solid.

Co-ordinate geometry: Cartesian coordinate geometry– rectangular coordinate axis, distance formula, Section formula, Area of a triangle, Centre of gravity or Centroid of a triangle, In-centre of a triangle, Circumcentre of a triangle, Orthocentre of a triangle, Collinearity of three points, Slope of a line, Different forms of equations of a straight line, Perpendicularity and parallelism, Length of perpendicular.

Self-study Component-Basics of geometry, formula, dimensions, shapes. Different types of lines. Example – parallel, intersecting etc.. 8 Hours

Unit-5

Time and Work: Relationship between time and work. Importance of efficiency, Conventional method of solving problems, L.C.M method, Negative work, The specific case of building a wall, Group work, Constant product rule, When work is not constant, Pipes and cistern– Similarity of logic.

Self-study Component-LCM methods, basic arithmetic.Fractions and efficiency.

4 Hours

Reference Books:

1. The Trachtenberg speed system of basic mathematics, published by Rupa publications.
2. CAT Mathematics by AbhijithGuha. published by PHI learning private limited.
3. Quantitative aptitude by Dr. R. S Agarwal, published by S.Chand private limited.
4. Verbal reasoning by Dr. R. S Agarwal , published by S. Chand private limited.
5. Quantitative aptitude for CAT by Arun Sharma, published by McGraw Hill publication.
6. Analytical reasoning by M.K Pandey BSC PUBLISHING.CO.PVT.LTD

Course Outcomes (CO)

After learning all the units of the course, the student is able to:

1. Solve problems of higher difficulty level with ease in the following topics– Time , speed and distance and Geometry. L5
2. Analyze the number of colored faces in a cube when it is cut into different number of pieces and solve the problems under clocks and calendars. L5
3. Apply the concept of L.C.M in the module time and work to solve the problems with comprehension. L2
4. Analyze the concepts in Co-ordinate geometry by spatial visualization. L4
5. Interpret the logic in the statements of syllogism by critical thinking and apply venn diagram for the effectives ways of deriving at the conclusion. L4
6. Determine the solutions for complicated problems of set theory using the concept of venn diagram. L4

Course Title : Additional Mathematics-II			
Course Code : P17MADIP41	**Semester : 4**	**L :T:P:H : 4:0:0:4**	**Credits: 0**
Contact Period: Lecture: 52 Hr, Exam: 3 Hr		**Weightage: CIE:50%, SEE:50%**	

Course Content

Unit-1

Linear Algebra: Introduction - Rank of matrix by elementary row operations - Echelon form of a matrix. Consistency of system of linear equations - Gauss elimination method. Gauss-Jordan and LU decomposition methods.Eigen values and eigen vectors of a square matrix. Application of Cayley-Hamilton theorem(without proof) to compute the inverse of a matrix-Examples. 10 Hours

Unit-2

Higher order ODE's: Linear differential equations of second and higher order equations with constant coefficients. Homogeneous /non-homogeneous equations.Inverse differential operators.Solutions of initial value problems.Method of undetermined coefficients and variation of parameters.Solution of Cauchy's homogeneous linear equation and Legendre's linear differential equation. 14 Hours

Unit-3

Multiple Integrals: Double and triple integrals-region of integration. Evaluation of double integrals by change of order of integration.

Vector Integration : Vector Integration :Integration of vector functions. Concept of a line integrals, surface and volume integrals. Green's, Stokes's and Gauss theorems (without proof) problems. Orthogonal curvilinear coordinates. 10 Hours

Unit-4

Laplace transforms: Laplace transforms of elementary functions. Transforms of derivatives and integrals**,** transforms of periodic function and unit step function-Problems only.Inverse Laplace transforms: Definition of inverse Laplace transforms. Evaluation of Inverse transforms by standard methods. Application to solutions of Linear differential equations and simultaneous differential equations. 12 Hrs

Unit-5

Probability: Introduction. Sample space and events.Axioms of probability.Addition and multiplication theorems.Conditional probability – illustrative examples.Bayes's theorem-examples. 6 Hrs

Text Book:

1. B.S. Grewal: Higher Engineering Mathematics, Khanna Publishers, New Delhi,42nd Ed. 2012.
